

8. (original) The stent assembly according to claim 1, wherein said trapping region comprises a divergent portion of said downstream portion.
9. (original) The stent assembly according to claim 1, wherein said trapping region is in an upstream portion of said downstream portion.
10. (original) The stent assembly according to claim 1, wherein said upstream portion comprises at least one of a meshwork and a plurality of coils.
- 11-13. (canceled)
14. (original) The stent assembly according to claim 1, further comprising a restrictor element disposed in at least one of said upstream and downstream portions, said restrictor element being adapted to limit expansion of said at least one of said upstream and downstream portions.
15. (original) The stent assembly according to claim 1, wherein at least one of said upstream and downstream portions comprises an anti-thrombogenic agent.
16. (original) The stent assembly according to claim 1, wherein at least one of said upstream and downstream portions comprises a thrombogenic agent.
17. (original) The stent assembly according to claim 1, wherein at least one of said upstream and downstream portions comprises a friction-enhancing material.
18. (original) The stent assembly according to claim 1, wherein at least one of said upstream and downstream portions comprises a friction-reducing material.
19. (original) The stent assembly according to claim 3, wherein said upstream portion is placeable in a blood vessel upstream of a bifurcation in a blood vessel system, said bifurcation comprising a first downstream path and a second downstream path, said downstream portion being placeable in said second downstream path, and a space between said downstream portion and said upstream portion is alignable with said bifurcation, such that blood flows to both said first and second downstream paths with embolic material being trapped in said trapping region.
20. (new) The stent assembly according to claim 1, wherein said trapping region is asymmetric about its longitudinal axis.
21. (new) The stent assembly according to claim 1, wherein said trapping region is asymmetric about a plane tilted at a non-zero angle with respect to a longitudinal axis of said trapping region.
